Wire framing and Prototyping with Figma

Aim

To design and develop low-fidelity wireframes and interactive prototypes using Figma, in order to visualize user interface structure, user flow, and overall application design before final development.

Procedure:

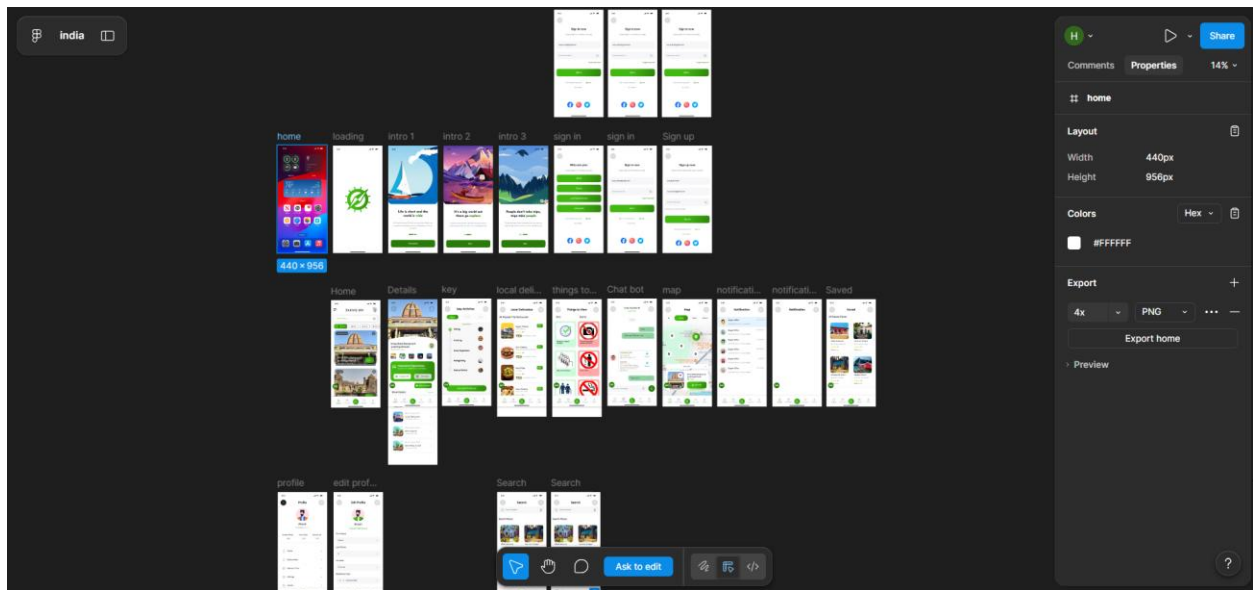

The app is a smart digital platform for eco-cultural tourism in Jharkhand, featuring a web app frontend with chatbot, AR/VR previews, AI assistance, and marketplace. Here's a short procedure outlining the core tourist UI flow based on the prototype description.

Tourist UI Flow

- Launch the web app or chatbot to explore destinations with AR/VR previews on Meta Quest hardware, viewing key activities, local delicacies, dos/don'ts, timings, taxi fares, and directions.
- Interact with multilingual AI chatbot for personalized itinerary planning, nearby essentials, and support based on preferences and duration.
- Access visa assist feature, which guides through e-Tourist Visa application and redirects to the official portal.
- Browse marketplace for homestays, handicrafts, events, ecotourism packages; hire verified guides with blockchain certification, handle bookings/payments via Razorpay.
- Submit feedback/reviews post-tour, with sentiment analysis stored in MongoDB backend.

This flow supports safe, immersive travel via FastAPI backend and Unity for AR/VR.

Output

Result:

Hence the experiment is completed and the output is verified..
